

Printing to any brand of printer from Google Chrome prints blank pages

May 22, 2015

This issue started happening after Google updated Chrome. The workaround is to use a different web browser like I.E. or Firefox for example or from Chrome do the following:

ctrl+shift+p keyboard shortcut (which prints using system dialog). Manually clicking the "print using system dialog" from within the chrome preview window does not work correctly. You can also save as a PDF and then print the PDF.

Once an official fix is known, I will post it here. Hopefully, Chrome will receive an update to fix the issue soon.
